**Abstract**

The concept of “systematic knowledge research” is being developed. Systematic knowledge research assumes an irreducible variety of types of knowledge (e.g. verbal, pictorial, theoretical, practical, explicit, implicit, technical, aesthetic, or ethical knowledge). The focus lies on researching the intersections and interactions of the different types of knowledge. At the same time, expansions and re-orientations of epistemology are connected with knowledge research. The desideratum to broaden and revise the traditional house of epistemology is met. What exactly knowledge research is capable of achieving and why it is of value is spelled out in the talk. Four examples shall illustrate knowledge research in action. Finally, the relation between different types of knowledge and creativity is brought into the focus of attention.
